Preview Document: Daily Country Industry Relative Market Movements Monitoring and Forecast Model

Caleb Ong Jun Yi

Contents

1   Introduction

Financial market time series generally exhibit volatility clustering during periods of market stress. There is also the phenomena of volatility co-movements across different financial assets; volatility effects from one asset can have spillover effects on other assets. Such movements and impacts can be used quantified and used as a tool to monitor the joint asset trends and volatility movements of broad markets and industries. Divergences or convergences in the correlation and sensitivities can also serve as early indicators of impending market movements, and imminent relative underperformance or overperformance, of an asset vis-à-vis other assets.

- Model inputs:
    - Time series returns
- Model outputs:
    - Correlation estimates
    - Beta estimates

2   Brief Summary

Dynamic Conditional Correlation (DCC) GARCH models are utilized to dynamically and jointly model the volatility, correlation, and sensitivity dynamics across different assets.

Correlation and beta estimates are made on a daily basis, and models are always refitted to incorporate the latest data, before making the next set of estimates. The next set of estimates are look-ahead approximations of correlations and beta. The previous period ex-ante forecast is compared to the current period ex-ante forecast to identify any unusual co-movements or deviations from usual trends.

Time series of broad markets and industry returns extracted from data vendors. The data then undergoes cleaning and pre-processing.

The best models are then selected based on statistical criteria. The models also undergo backtesting to assess their effectiveness.

3 Sample Outputs

This section showcases some examples of analytical outputs for the some GICs stock market sectors, as well as some investment style factors, for USA.

The tables exhibit some examples of daily automated correlation and beta outputs, which are used to analyse any potential imminent divergences or convergences of the industries.

Figures 1 and 2 shows the evolution of the out-of-sample dynamic correlations and the cumulative returns of the selected index ("portfolio"), when compared against the returns of other industries ("benchmark"). Figures 3 and 4 shows the evolution of the out-of-sample dynamic beta and the cumulative returns of selected portfolios ("portfolio"), when compared against the returns of a selected ("benchmark"); Forecasted correlation and beta changes of a large magnitude are usually associated with a divergence or convergence in the pairwise relative performances, or a general increase in relative pairwise volatility.

Note:

Columns indicate the benchmark whose forecasted variance are used in the forecasted beta calculation.
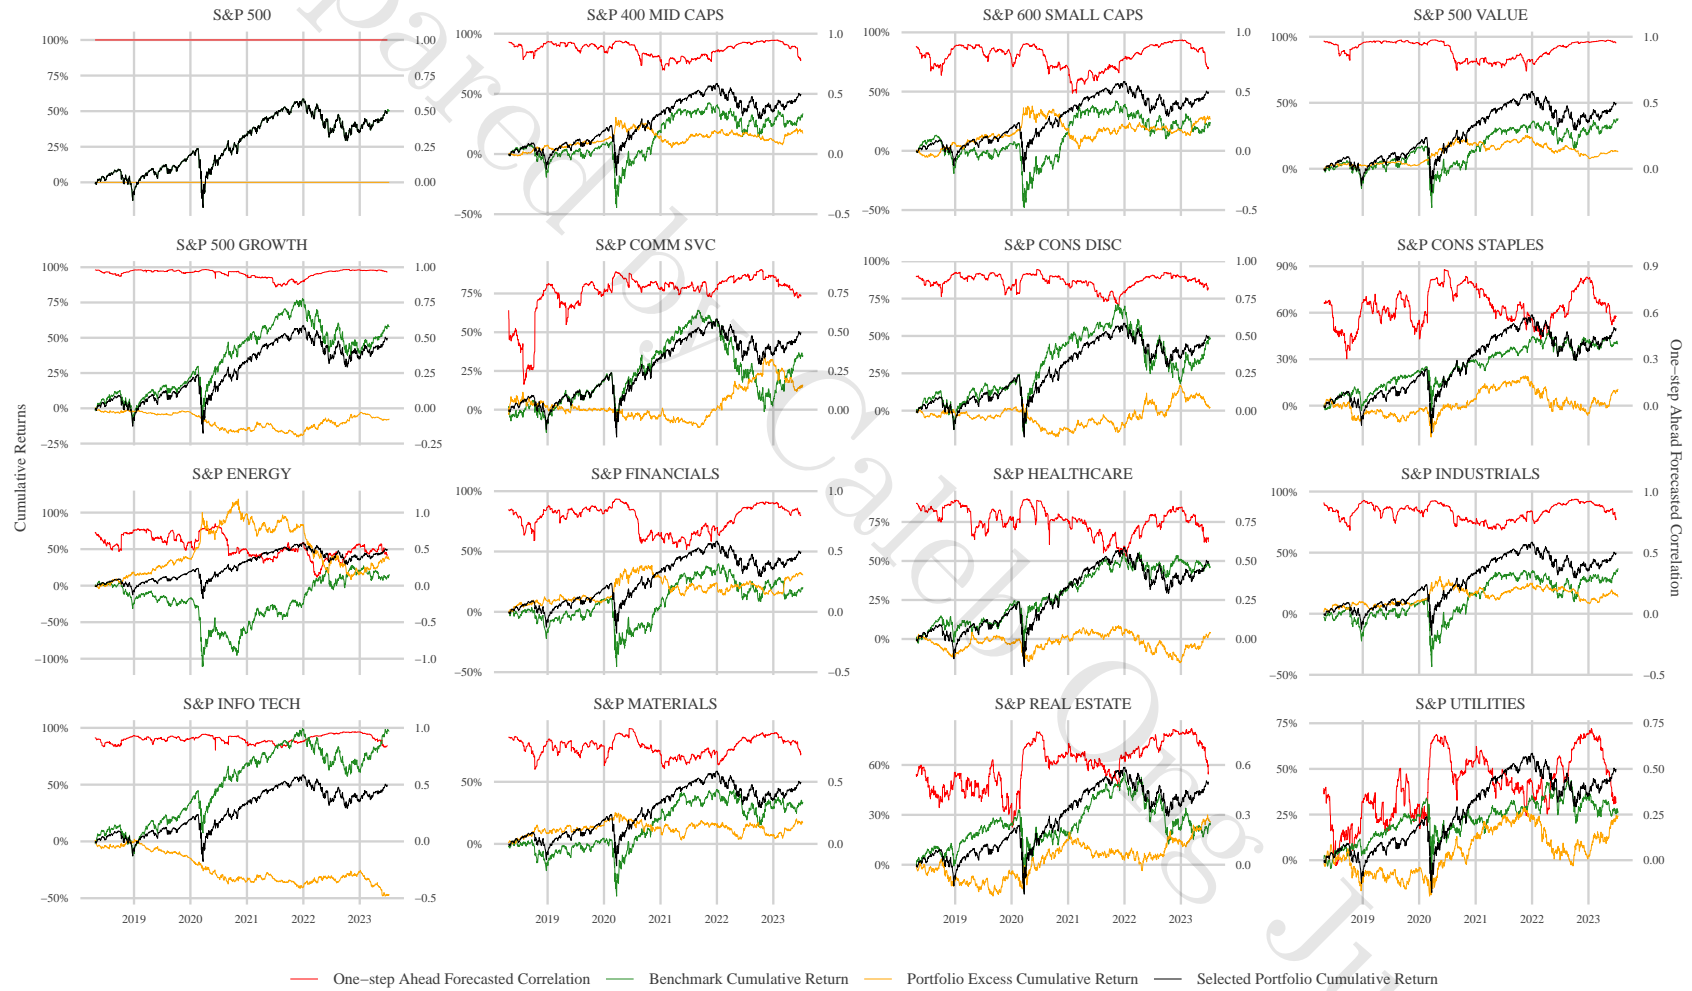

Figure 1: Comparison of forecasted pairwise correlations of S&P500, with cumulative returns. Correlation divergences and convergences can serve as indicators of relative overperformance or underperformance (asset co-movements and co-volatility), between asset pairs, for further analysis.

Out–of–Sample One–step Ahead Correlation Forecasts and Relative Returns

Forecasts are based on rolling windows
Selected Portfolio for Comparison: S&P FINANCIALS

Legend: One–step Ahead Forecasted Correlation — Benchmark Cumulative Return — Portfolio Excess Cumulative Return — Selected Portfolio Cumulative Return

Figure 2: Comparison of forecasted pairwise correlations of S&P Financials, with cumulative returns. Correlation divergences and convergences can serve as indicators of relative overperformance or underperformance (asset co-movements and co-volatility), between asset pairs, for further analysis.

Out–of–Sample One–step Ahead Beta Forecasts and Relative Returns

Forecasts are based on rolling windows
Selected Benchmark for Beta Comparison: S&P 500

One–step Ahead Forecasted Beta — Portfolio Cumulative Return — Portfolio Excess Cumulative Return — Selected Benchmark Cumulative Return
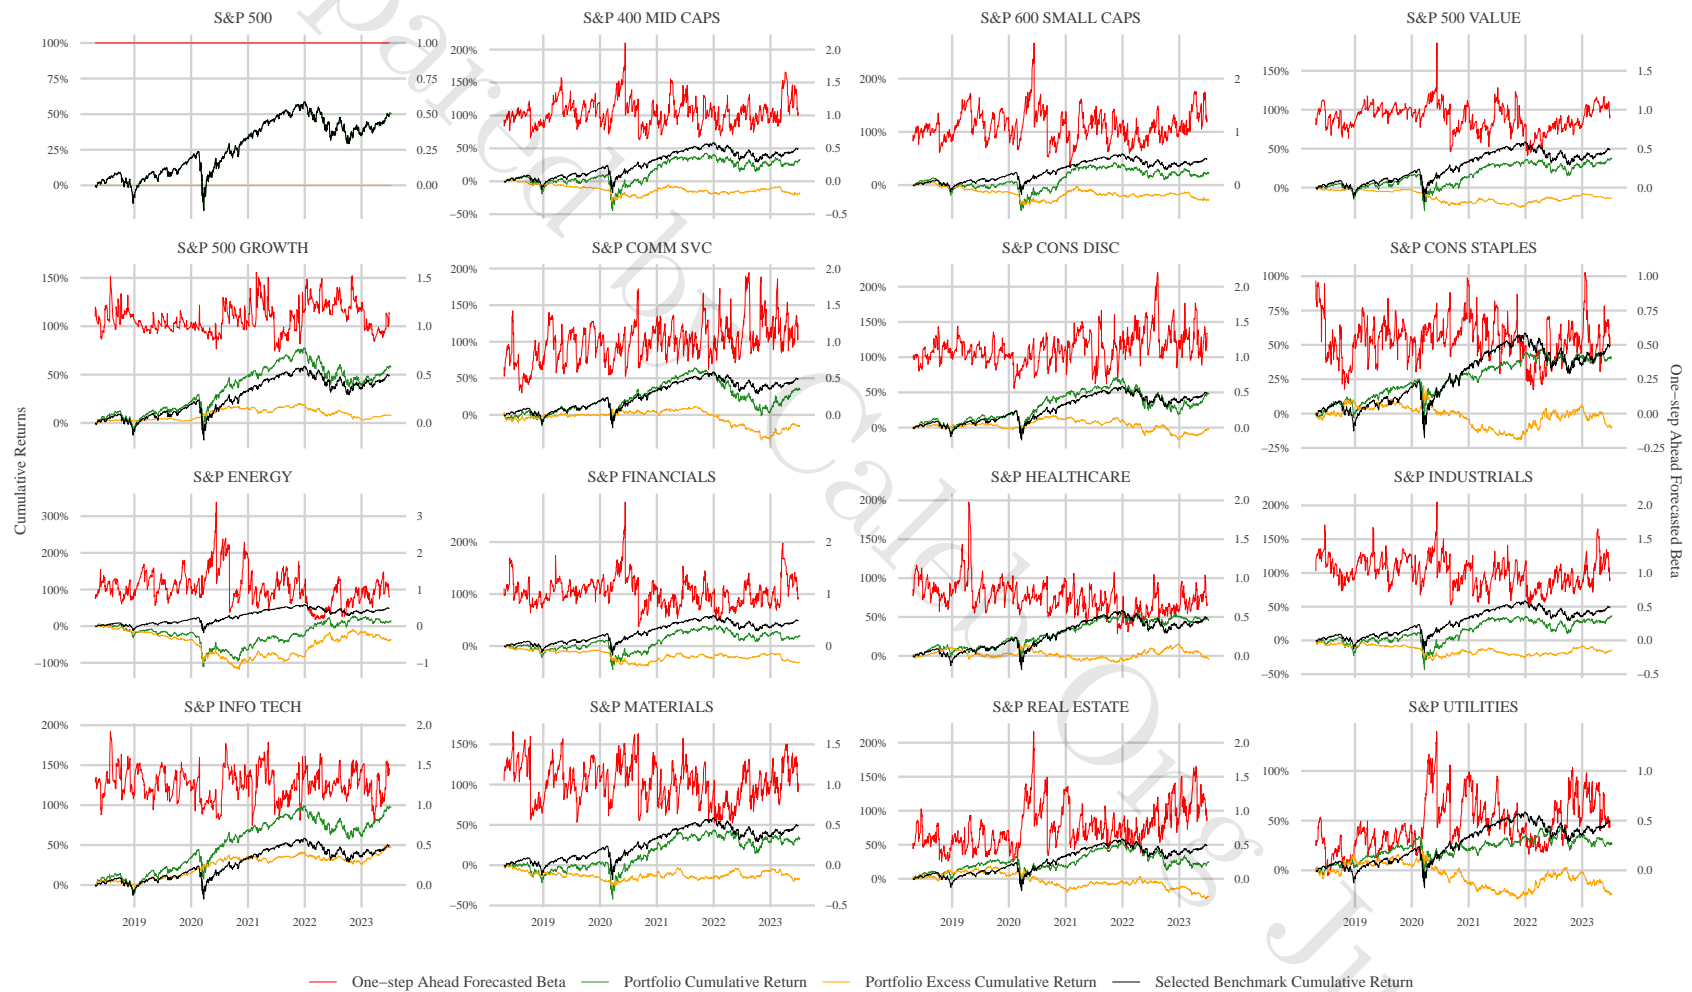

Figure 3: Comparison of forecasted beta, with S&P500 as the selected benchmark, with cumulative returns. Beta trends and changes can serve to identify any deviations in the return sensitivities magnitude between asset pairs, for further analysis.
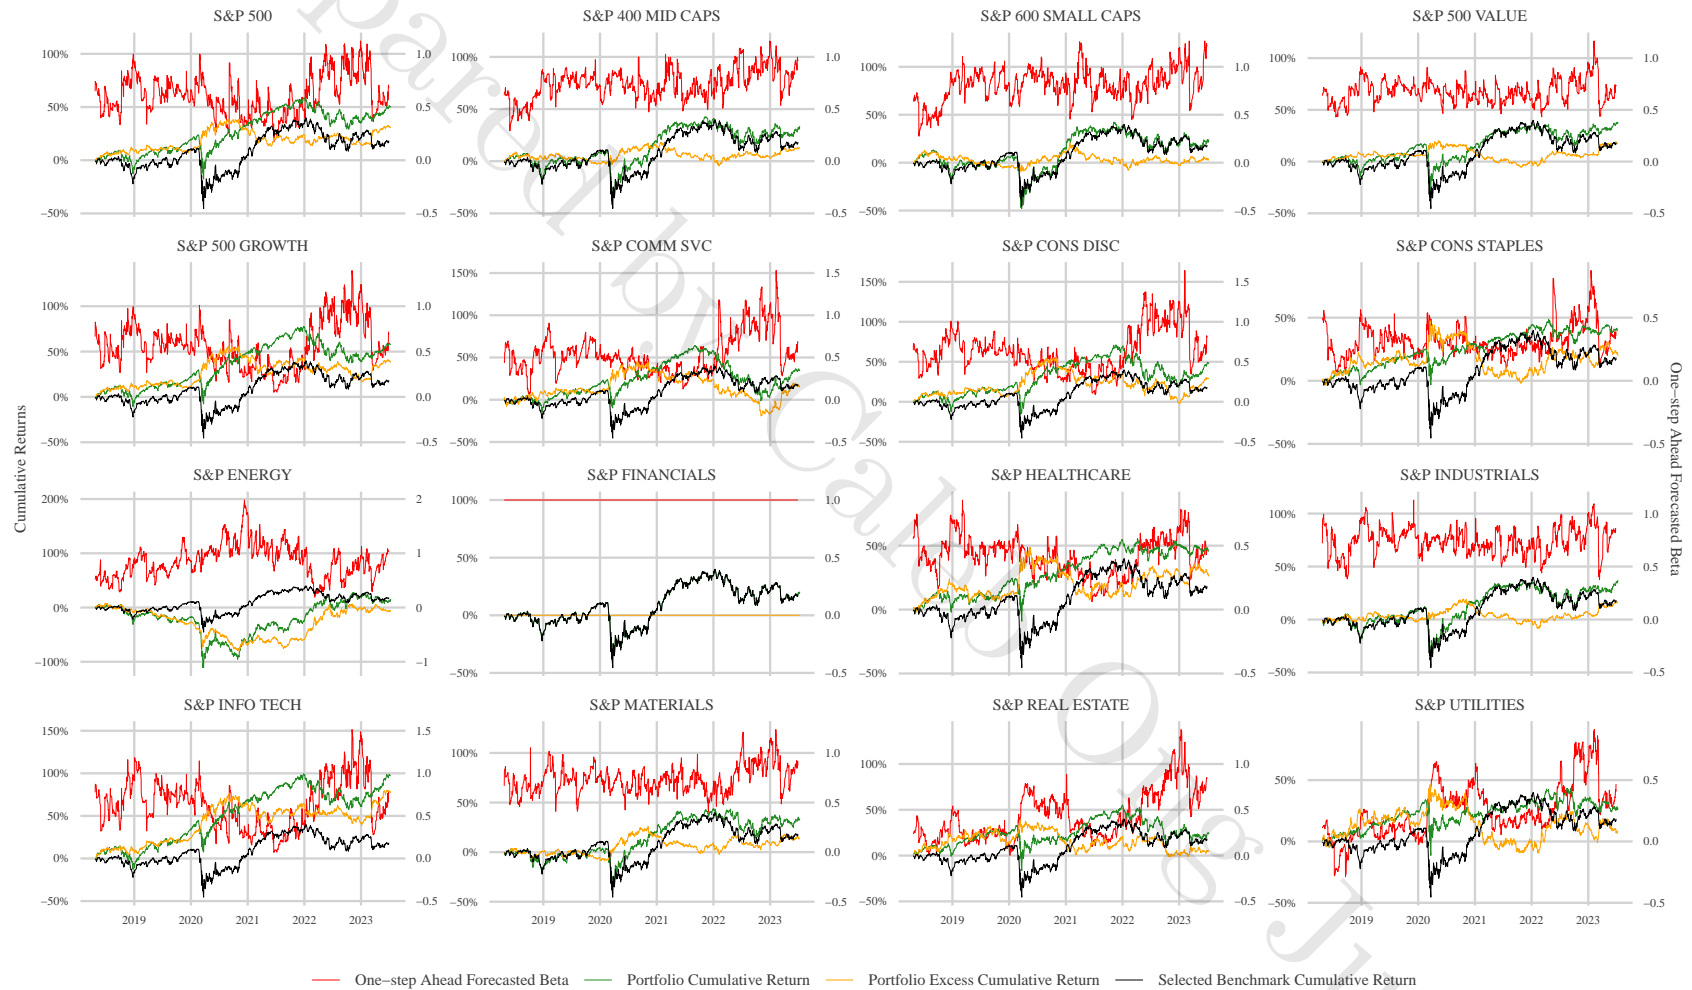

Figure 4: Comparison of forecasted beta, with S&P Financials as the selected benchmark, with cumulative returns. Beta trends and changes can serve to identify any deviations in the return sensitivities magnitude between asset pairs, for further analysis.

4 Ending Notes

Correlation and sensitivity estimates can provide insights on the co-movements of trends and relative volatility across different assets and industries, for the next steps of investigation.
